Industry Leadership: Environmental Initiatives

Because it is the right thing to do

Alexander's Mobility Services' core business utilizes consumables that could have an environmental impact – particularly fossil fuels and paper. Supporting our vision and mission of being an industry leader, we have implemented several environmentally-focused initiatives to minimize or eliminate that impact.

On the Road

Generators instead of idling diesels

It was once common for drivers to leave their massive diesel engines running for heat and electricity during stops. Now Alexander's drivers have generator systems to provide their on-board electricity needs and to warm engines for easier starts.

Clean Machines

Our operations team closely monitors the maintenance schedules for all of our equipment to ensure it is performing at peak efficiency. Our monitoring software tells us when equipment should be serviced, lubricated, oil-changes, even washed. We continually rotate out old, inefficient trailers and invest in modern, lightweight rolling stock to ensure our fleet is operating at peak efficiency and performance.

P.S.I. Tire Inflation System

All Alexander's trailers utilize the P.S.I. Tire Inflation System for peak efficiency, minimized emission impact, fuel economy and maximized tire wear. U.S. Environmental Protection Agency recognizes the systems effectiveness and recommends it as an industry standard.

EZPass & Prepass

The same EZPass transponders you use for toll roads, tunnels and bridges save our drivers time and - literally - energy by eliminating fuel consuming idling and acceleration at toll stops.

Prepass transponders help our drivers roll past weigh stations by sending all the appropriate information digitally to the station. If there are no weight and safety issues the driver gets a green light to continue on their journey without the fuel-consuming stop.

In the Office

When Documents Aren't Documents

Alexander's offices used to be consumed by massive filing cabinets filled with years-worth of documentation. No longer...we now create digital files of all federal and state required moving documentation. We have eliminated literally tons of paperwork and made accessing information a quick mouse click away.

Handheld computers have replaced traditional survey paperwork creating a more accurate and efficient way to communicate work estimates.

Energy Star electronics have proven to save companies thousands in energy costs and represent a tangible example of wise energy management. Alexander's always looks for the Energy Star Qualified label when purchasing equipment

On the Job

Post Move Recycling

Traditionally, moving generates an avalanche of paper and cardboard. It remains the staple of our industry and the best available method to protect household effects for transport. Alexander's recognizes the potential impact of post-move debris and has endeavored to do all we can to reduce, reuse and recycle.

Currently, we recycle nearly 80% of all post-move paper and cardboard debris. This far exceeds state environmental mandates. Alexander's facilities are equipped with their own balers to keep the warehouse looking good and making the recycling process more efficient.

Brand New Packing...Again

We work closely with select vendors to ensure we get the best recycled materials available without sacrificing cleanliness or structural integrity. On commercial relocations, reusable packing and containers - like TYGA plastic bins, reusable plastic zip bags, and sturdy plastic speed bins - are a few of the innovative materials that are commonplace on our projects.
